## Technical Advisory

### Note

No. 0701

Date: 17/07/2007

---

**Attention:** All Dealer Workshop & Installation Personnel

**Subject:** Holden Model VE Series - Vehicle Speed Sensor

---

We have been advised by General Motors Holden that the latest VE series commodore is now fitted with CANBUS and the only acceptable method of connection of a taximeter for distance pulses is via a suitable interface.

Holden have released an approved factory built device called a :-

#### **“Speed Sensor Interface Module” Part No 92196495**

This device is available from any Holden Dealer spare parts division but at this stage will not be a stocked item. They will need to source it from Melbourne so allow for this delay. List price is \$175.00 but if the demand is there we may be able to buy in bulk and supply our dealer network at a trade price.

Some dealers have accessed the pulse generator output directly at the gearbox or further up the loom however reports are coming back that this is not always successful and we strongly recommend against this procedure.

At this stage we have not been advised as to number of pulses/ km nor any pulse shape indication. Any feedback in this regard would be appreciated.
